Topic 5: Optimise Personal Productivity

Assoc. Professor Agnis Stibe

Challenge	Typical manager situation	Productivity problem
1. Everything feels urgent	Product issue, senior-management request, partner escalation, and team problem arrive simultaneously.	Difficulty distinguishing urgent work from high-impact work.
2. Meeting overload	Calendar is filled with stand-ups, cross-functional meetings, reviews, and ad-hoc discussions.	Little uninterrupted time for thinking and important decisions.
3. Constant Zalo messages	Team members and stakeholders expect rapid responses throughout the day.	Attention fragmentation and continuous context switching.
4. Managing upward and downward	Senior leaders want fast results while team members need guidance and decisions.	Manager becomes the execution bottleneck.
5. Too many decisions	Dozens of small approvals, prioritisation choices, and exceptions reach the manager every day.	Decision fatigue and cognitive overload.

Challenge	Typical manager situation	Productivity problem
6. AI creates more work, not less	Manager uses AI for reports, summaries, analysis, content, and ideation but constantly checks and revises outputs.	AI increases information volume without necessarily increasing value.
7. Knowing what to do but not doing it	Manager knows the strategic priorities but spends most of the day responding to immediate demands.	Classic Knowledge–Behaviour Gap.
8. Delegation vs. "I can do it faster myself"	Under deadline pressure, the manager takes work back from employees.	Short-term efficiency creates long-term dependency and overload.
9. Cross-functional dependencies	A launch requires product, engineering, marketing, data, legal, and commercial teams.	Manager spends excessive cognitive energy coordinating dependencies.
10. Performance vs. wellbeing	High-growth expectations encourage long hours and permanent availability.	Short-term output may undermine sustained hyper-performance.

EXAMPLE

It is 9:00 AM on Monday.

You have planned two hours to prepare a strategically important proposal.

By 9:20, you have 34 unread Zalo messages, your director asks for numbers by noon, a key employee needs an urgent decision, another team requests approval, and AI has generated a 15-page analysis you need to review.

What do you do next?

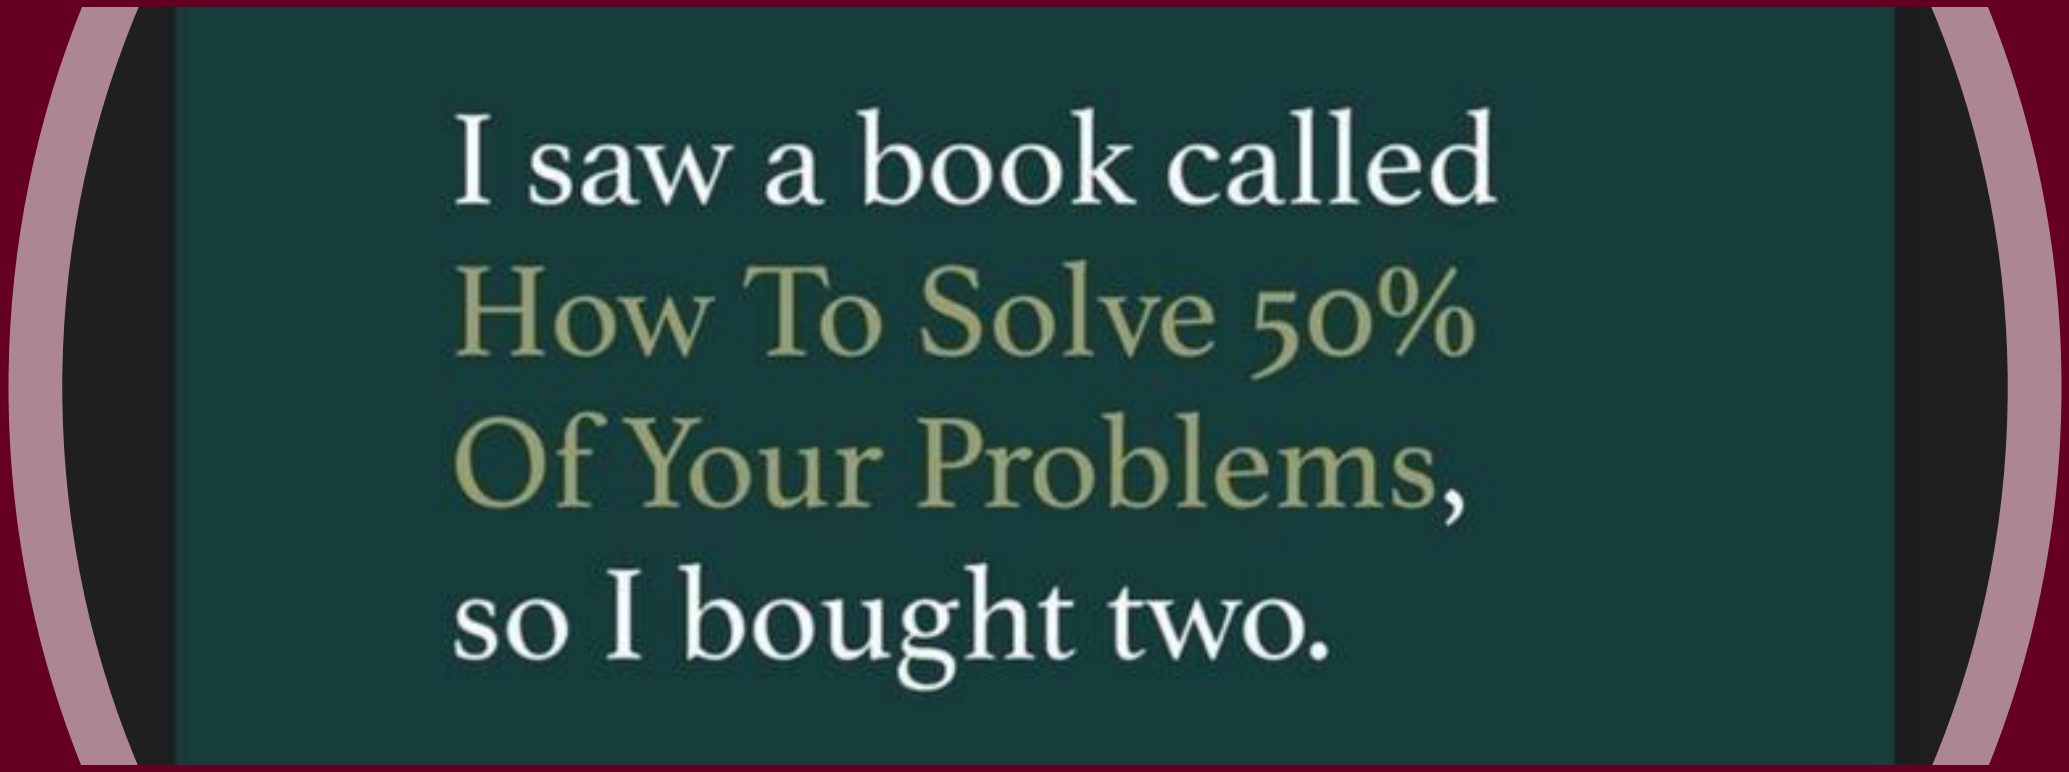

EXAMPLE

- **Make four decisions:**
  - Do now / Schedule / Delegate or AI-augment / Eliminate or decline.
- **Then ask:**
  - Which of these tasks requires me?
  - Which requires another human?
  - Which can be handled by AI?
  - Which should not be done at all?

Conservation of energy

The law of conservation of energy states that **energy can neither be created nor destroyed - only converted from one form of energy to another**. This means that a system always has the same amount of energy, unless it's added from the outside.

Knowledge Behavior Gap Model: An Application for Technology Acceptance

Abstract. Organizational change initiatives and societal health campaigns often fail or produce unsustainable outcomes. Intense trainings and knowledge sharing not always lead to expected behavioral results. Is there a gap between what people know and what they do? This paper investigates ways for understanding and closing this gap. It reviews the literature related to innovation diffusion and technology acceptance. Based on that, it develops a Knowledge Behavior Gap model, containing four main constructs: knowledge, acceptance, intention, and behavior. To validate the model, a quantitative survey instrument was design. Using it, eighty-three valid responses were collected. Partial least squares structural equation modeling method was used to analyze the data and test the model. The results demonstrate a strong and significant path from knowledge to behavior that leads through acceptance and intention. Interestingly, the paths from knowledge to acceptance and from intention to behavior both get even stronger with age. Meaning that for older people knowledge is a more powerful predictor of acceptance and intention is a more seriously influencing behavior. As the main contribution to science and practice, the model provides a more consistent way for measuring and predicting the success of envisioned organizational and societal changes. Thus, researchers are encouraged to advance Knowledge Behavior Gap model, while professionals are invited to apply it for enhancing desired transformations towards hyper-performance.

The FranklinCovey Time Matrix®

The Time Matrix is a tool for triaging every activity through the Thinking brain, with a bias towards things that are important – but not urgent (The Q2 quadrant of extraordinary productivity). The more time we can spend in Q2, the less we'll be dealing with other people's urgencies.

What Is the Eisenhower Matrix? A Complete Guide to Prioritization

Getting Things Done (GTD) Method

KEY TAKEAWAYS

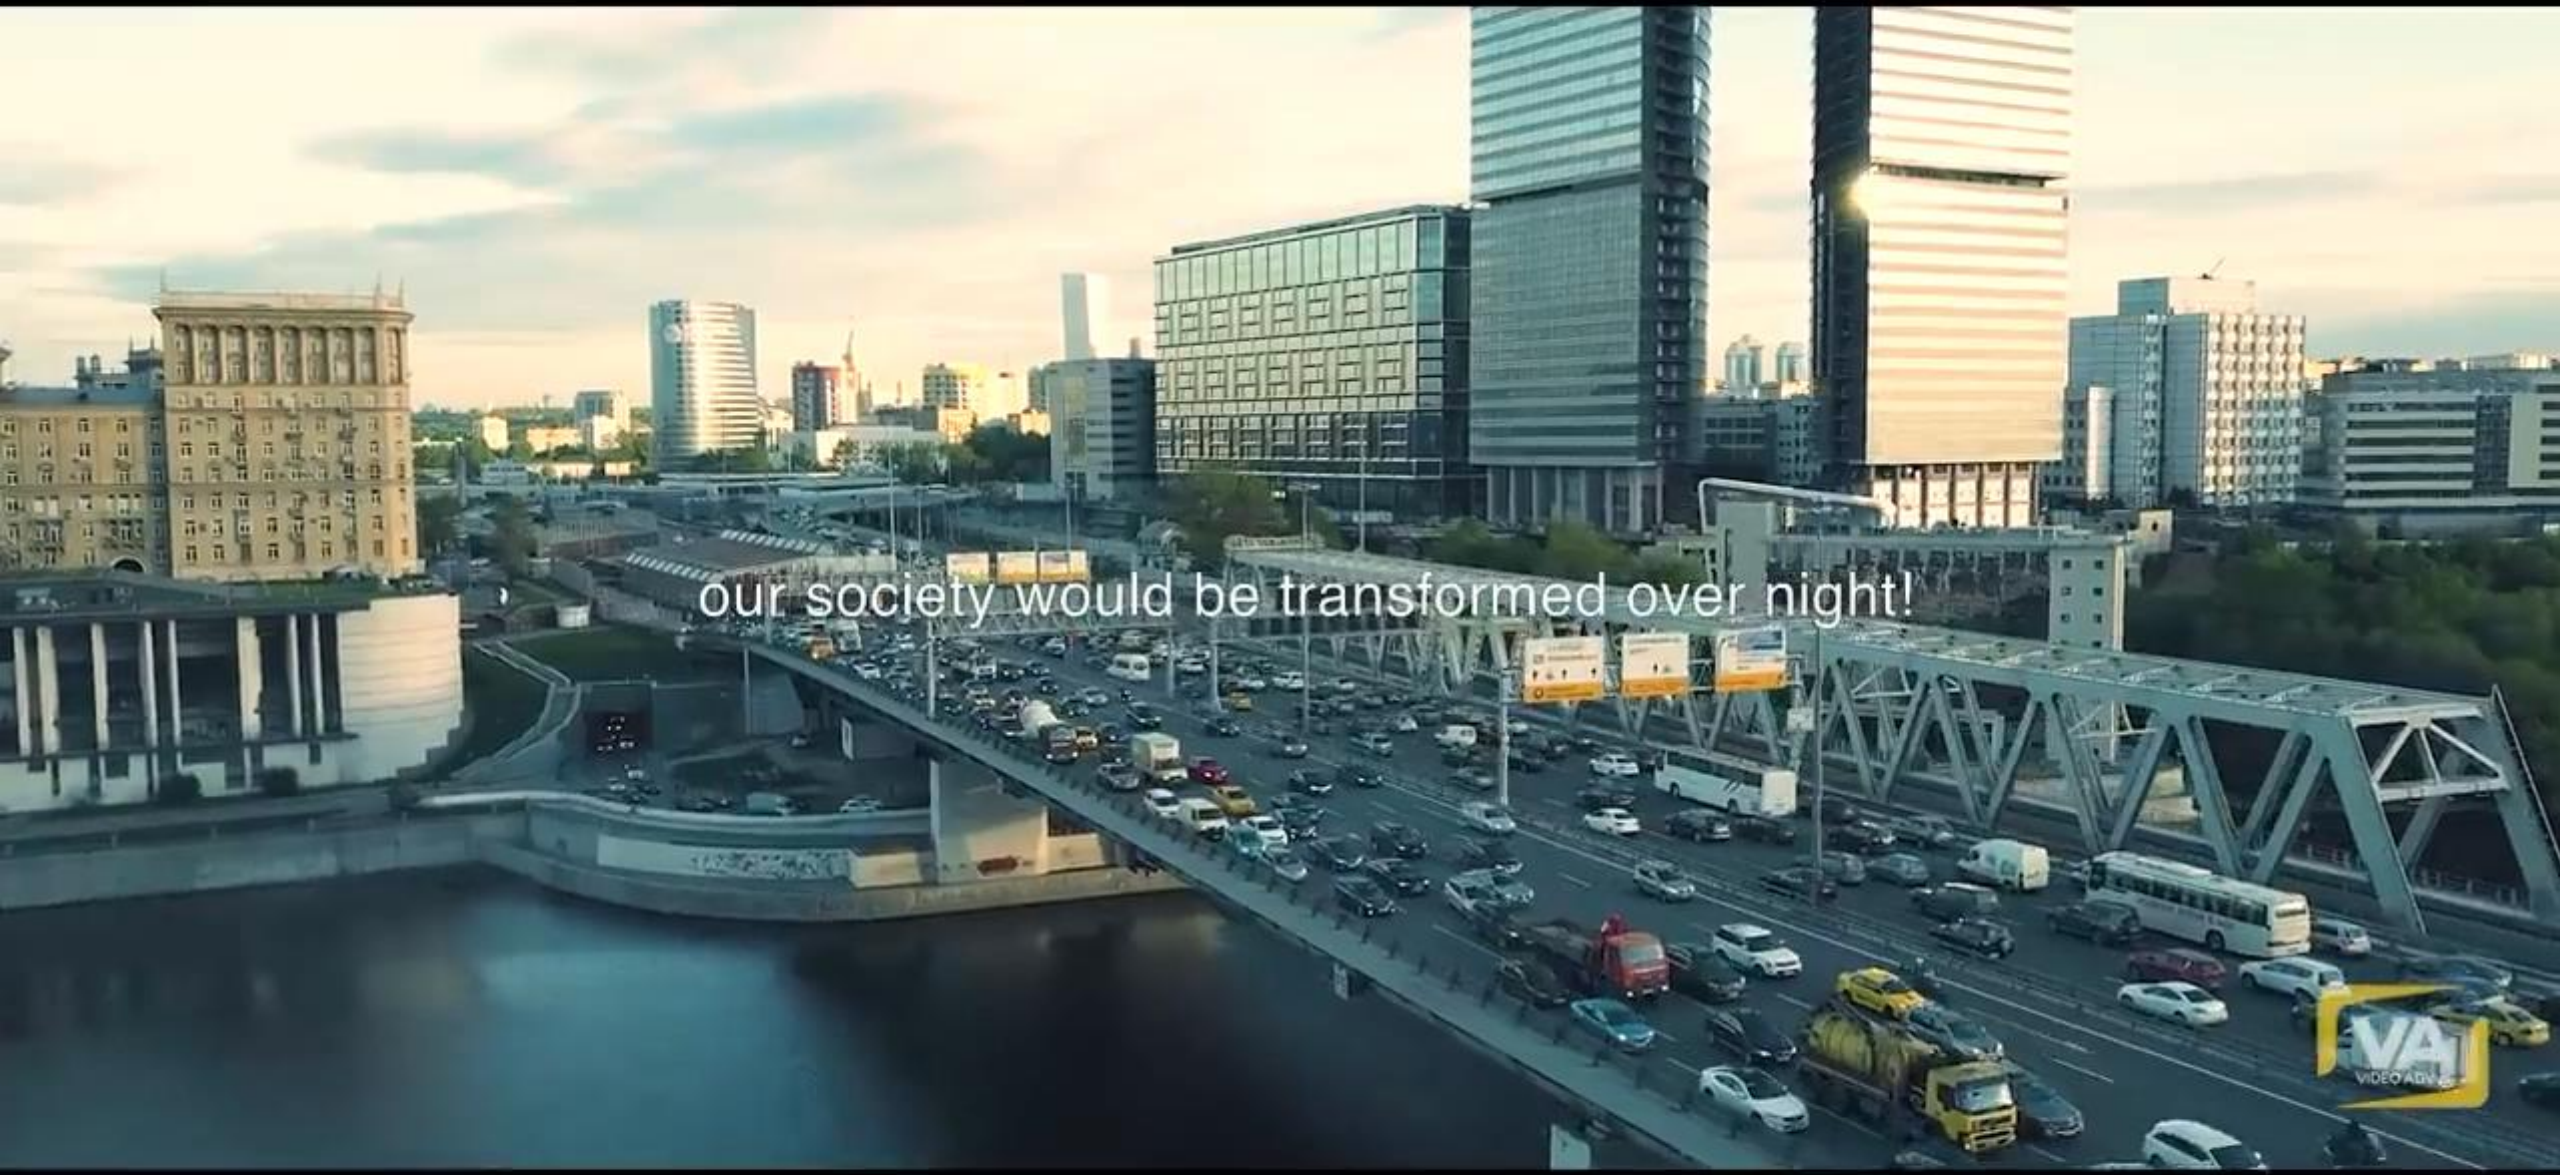

- **Productivity is about impact, not activity.** Focus limited attention and energy on work that creates the greatest value.
- **Prioritization means deliberate trade-offs.** Exceptional performance requires deciding what not to do, defer, delegate, or automate.
- **Protect attention as a strategic resource.** Reduce interruptions, task switching, and low-value information consumption.
- **Manage cognitive load.** Simplify decisions, externalise routine thinking, and create space for complex judgment and creativity.
- **Use Human Artificial Intelligence (HAI).** Combine distinctly human strengths—judgment, purpose, creativity, empathy, and accountability, with AI's speed, analytical capacity, and scalability.

KEY TAKEAWAYS

- **Use AI to augment, not replace, judgment.** Delegate appropriate cognitive work to AI while retaining human ownership of consequential decisions.
- **Turn priorities into behaviors.** Strategic intentions create results only when translated into specific, repeatable daily actions.
- **Design the environment for execution.** Good systems, routines, prompts, and defaults reduce dependence on motivation and willpower.
- **Close the Knowledge Behavior Gap.** Knowing what matters is insufficient; productivity comes from consistently doing what matters.
- **Optimize for sustainable hyper-performance.** The goal is not maximum short-term output, but sustained high-value performance without unnecessary cognitive overload or long-term harm.

CORE MESSAGE

- *Do **less** of what consumes attention.*
- *Do **more** of what creates value.*
- ***Use AI** to expand capability while keeping human judgment in control.*

our society would be transformed over night!

What is Hyper-Performance? Your Shortcut to Success | FNEG...

435 views • 10 months ago

Hyper-performance is a state of optimal performance where all the negative, counterproductive, and useless human thinking is minimized or removed completely. This includes poor judgments, destructive thoughts, subjective biases, bad decisions, and other obstacles that hinder performance.
