## Topic 6: Delegation & Accountability in Fast-Paced Teams

Assoc. Professor Agnis Stibe

| Challenge | Typical management situation | Leadership question |
|---|---|---|
| **1. “It’s faster if I do it myself.”** | Under deadline pressure, the manager takes work back from the team. | What should I delegate even when delegation initially takes longer? |
| **2. Delegation without real authority** | An employee owns a task but still needs the manager’s approval for every meaningful decision. | Am I delegating responsibility **and** decision rights? |
| **3. Accountability is unclear** | Product, tech, marketing and operations are involved, but nobody feels ultimately responsible. | Who is the **single accountable owner**? |
| **4. The best people get everything** | High performers repeatedly receive critical assignments until they become overloaded. | Am I optimizing today's delivery at the expense of tomorrow's capability? |
| **5. Everything becomes “urgent”** | Multiple senior stakeholders request immediate action and the manager passes all priorities to the team. | What should we **stop, postpone or deprioritize**? |

| Challenge | Typical management situation | Leadership question |
|---|---|---|
| **6. Manager becomes the decision bottleneck** | Team members escalate even relatively small decisions upward. | Which decisions could the team safely make without me? |
| **7. Micromanagement vs. visibility** | The manager wants accountability and therefore asks for constant updates. | How can I maintain visibility without controlling execution? |
| **8. Cross-functional dependency** | Your team owns the result but needs another team to deliver something first. | How do we create accountability when authority is distributed? |
| **9. AI makes ownership ambiguous** | AI produces analysis, content, code, summaries or recommendations that employees use. | Who remains accountable for an AI-assisted decision or output? |
| **10. Wrong human–AI task allocation** | People spend hours on work AI could handle, while AI is used for decisions requiring contextual human judgment. | Should this task be Human, AI, or HAI? |

# EXAMPLES

**“Everything needs my approval.”**

→ delegation + empowerment

**“Everyone is involved, but nobody owns the outcome.”**

→ accountability + decision rights

**“My best people are overloaded.”**

→ capability-based delegation + cognitive load

**“AI makes us faster, but who is responsible for what it produces?”**

→ HAI + human accountability

**“Everyone is busy, but important things are still late.”**

→ prioritization + bottlenecks + team cognitive load

# KEY QUESTION

How can you increase your team's ownership and speed while reducing the number of decisions that need to come back to you?

# The purpose of innovations

Advice from Agnis Stibe, Transformational Designer

**Artificial intelligence (AI) is going to be just another buzzword if we won't try zooming out and locating it within a bigger picture of our lives. What is AI? What is the purpose of AI? This discussion is currently missing from the discourse around AI. To a certain degree, everyone is interested in talking about AI, many say it is important, but why? How? For whom? How AI will influence our daily routines? Finding answers to these questions is essential already today.**

# KEY TAKEAWAYS

- **Delegate outcomes, not just tasks** – clarify the expected result, ownership, decision authority, and success criteria.
- **Match work to capability** – assign responsibilities based on strengths, readiness, priorities, and development opportunities.
- **Accountability is clarity + ownership + follow-through** – people perform better when they know what they own and how success will be measured.
- **Empower without micromanaging** – establish clear boundaries and checkpoints while giving people autonomy over execution.
- **Use HAI to amplify team performance** – combine human judgment, creativity, and contextual understanding with AI speed, analysis, and automation.

# KEY TAKEAWAYS

- **Put the right intelligence on the right task** – consciously decide what should be done by humans, AI, or through human–AI collaboration.
- **Reduce cognitive load by designing clarity** – simplify roles, priorities, communication channels, workflows, and decision rights.
- **Remove bottlenecks, not just push harder** – identify dependencies, unnecessary approvals, unclear ownership, and overloaded team members.
- **Create psychological safety with accountability** – enable people to raise concerns, acknowledge mistakes, challenge assumptions, and learn without weakening responsibility for results.
- **Build continuous improvement into execution** – use feedback, reflection, behavioral learning, and AI-enabled insights to improve the team over time.

# CORE MESSAGE

- *High-performing teams emerge when **leaders create** clarity, ownership, autonomy, intelligent human–AI collaboration, and continuous learning.*
- *Enabling faster execution **without** increasing unnecessary **cognitive load**.*

## What is Hyper-Performance? Your Shortcut to Success | FNEG...

435 views • 10 months ago

Hyper-performance is a state of optimal performance where all the negative, counterproductive, and useless human thinking is minimized or removed completely. This includes poor judgments, destructive thoughts, subjective biases, bad decisions, and other obstacles that hinder performance.
